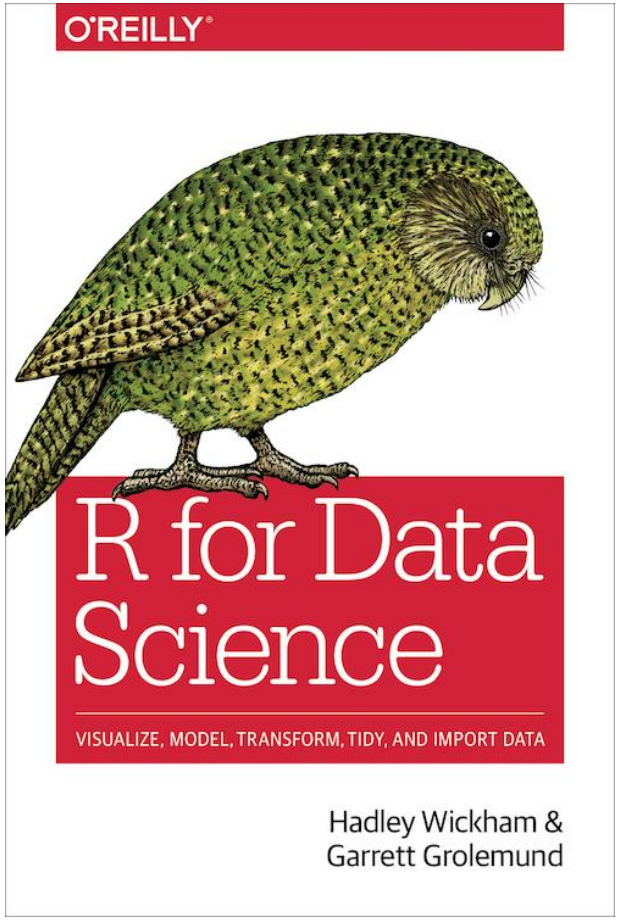
This week

1. (Data preparation 2/2)
2. (Cloud computing guest lecture)
3. **Data visualization principles & Grammar of graphics**

Reading materials for this week

- Chapters from **R for Data Science (R4DS), open access book at:**
- https://r4ds.had.co.nz

- Today: ch 3 visualization
- Tomorrow: chh 3, 5, 7



Carte Figurative des pertes successives en hommes de l'Armée Française dans la campagne de Russie 1812-1813.

Dressée par M. Minard, Inspecteur Général des Ponts et Chaussées en retraite.

Paris, le 20 Novembre 1869.

Les nombres d'hommes présents sont représentés par les largeurs des zônes colorées à raison d'un millimètre pour dix mille hommes; ils sont de plus écrits en travers des zônes. Le rouge désigne les hommes qui entrent en Russie, le noir ceux qui en sortent. — Les renseignements qui ont servi à dresser la carte ont été puisés dans les ouvrages de M.M. Thiers, de Ségur, de Fezensac, de Chambray et le journal inédit de Jacob, pharmacien de l'Armée depuis le 28 Octobre.

Pour mieux faire juger à l'œil la diminution de l'armée, j'ai supposé que les corps du Prince Jérôme et du Maréchal Davoust qui avaient été détachés sur Minsk et Mobilow en ont rejoint vers Orscha et Witebsk, avaient toujours marché avec l'armée.

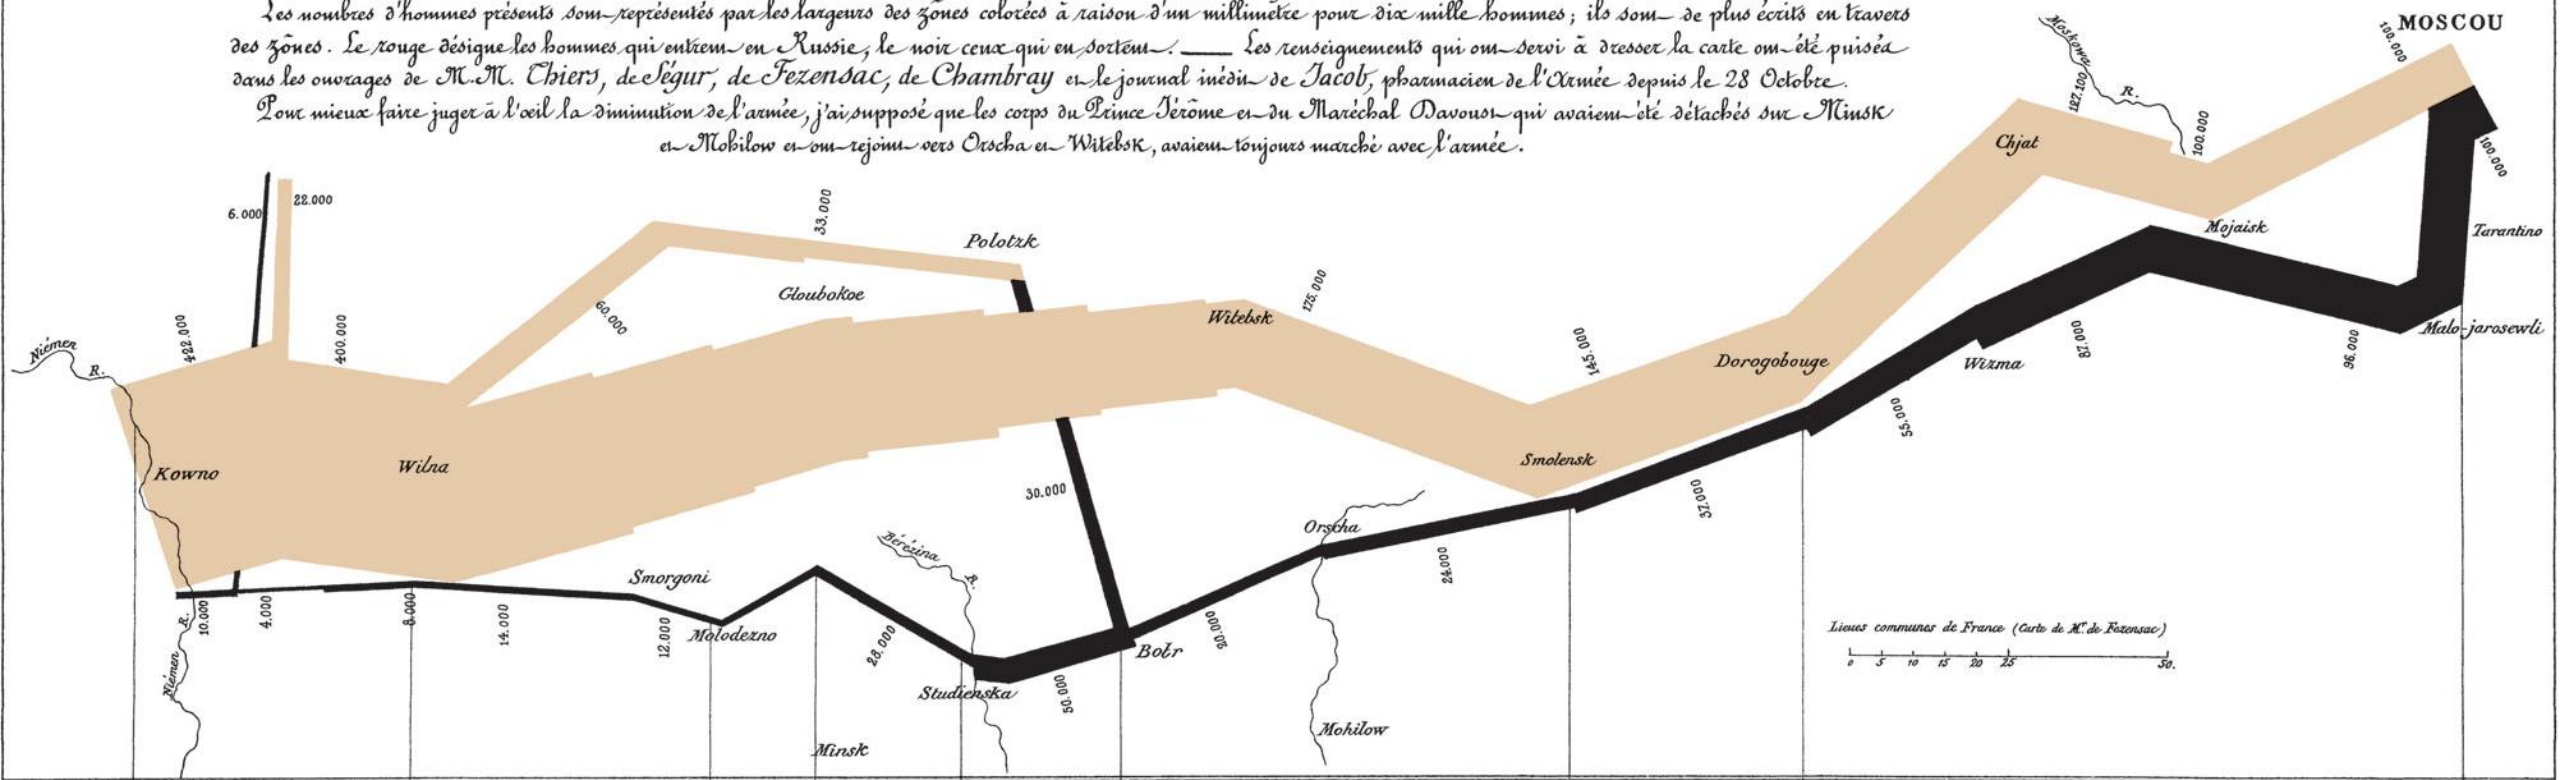


TABLEAU GRAPHIQUE de la température en degrés du thermomètre de Réaumur au dessous de zéro.

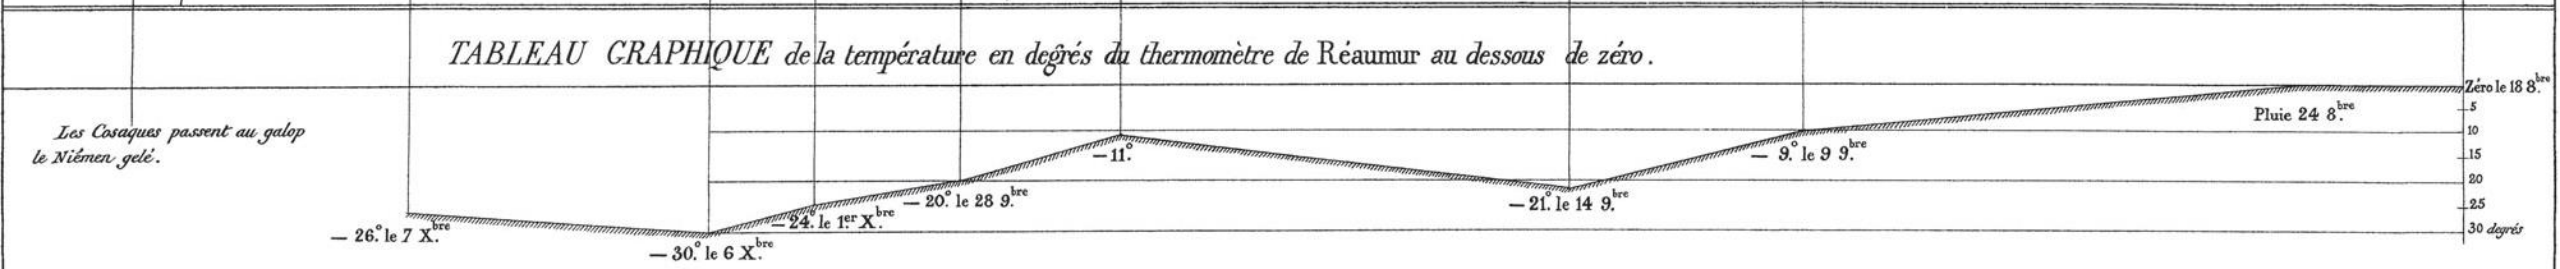

Autog. par Regnier, 8. Pas. Ste Marie St Gain à Paris.

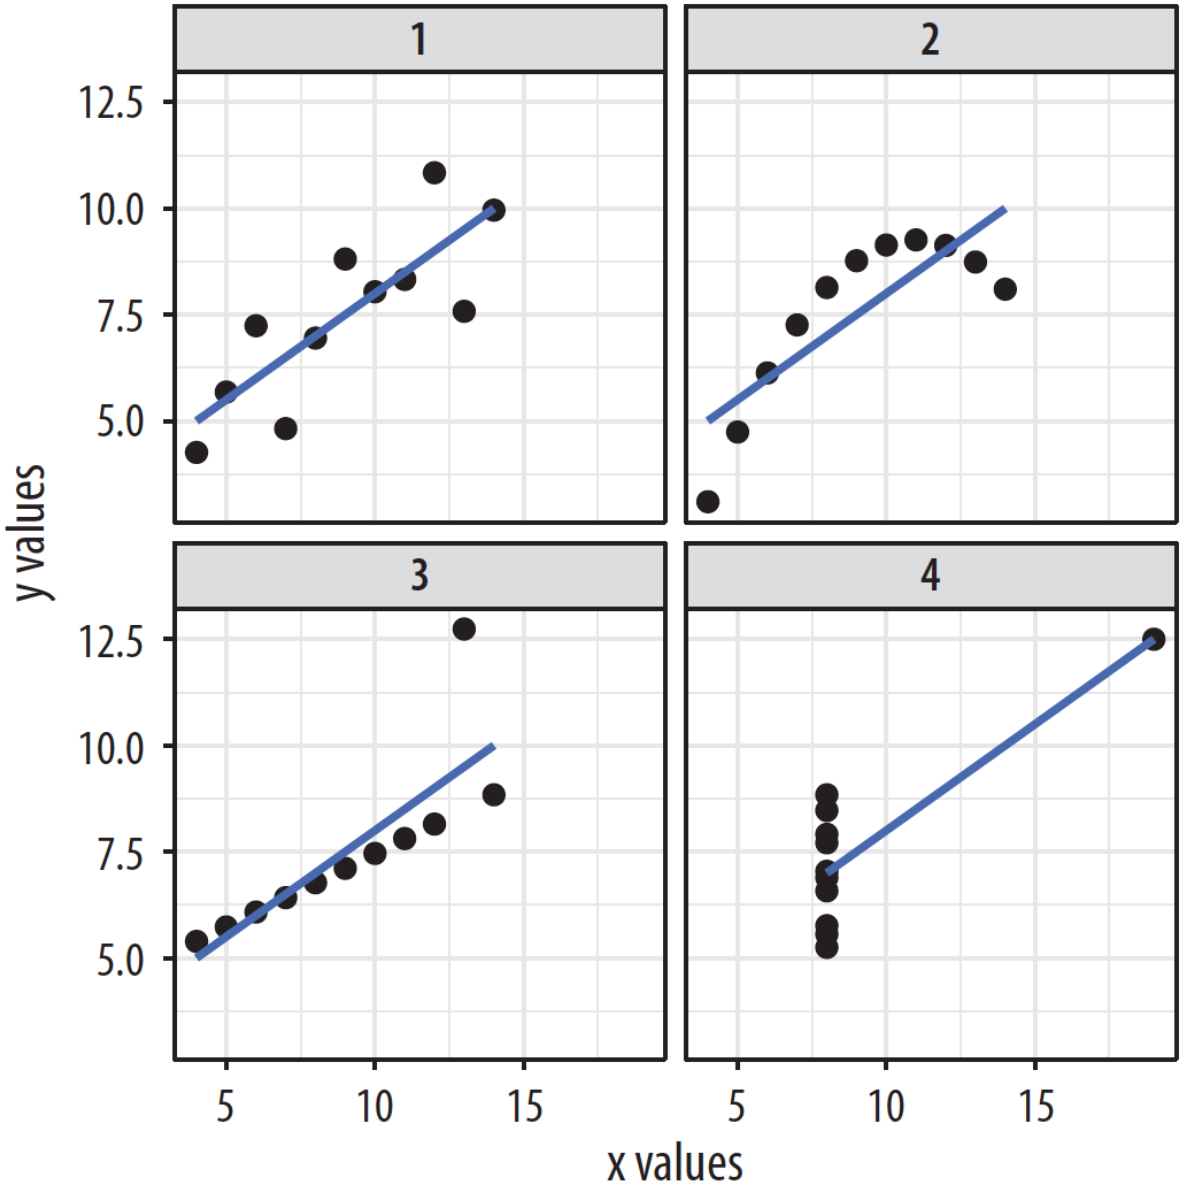
Today: visualization principles

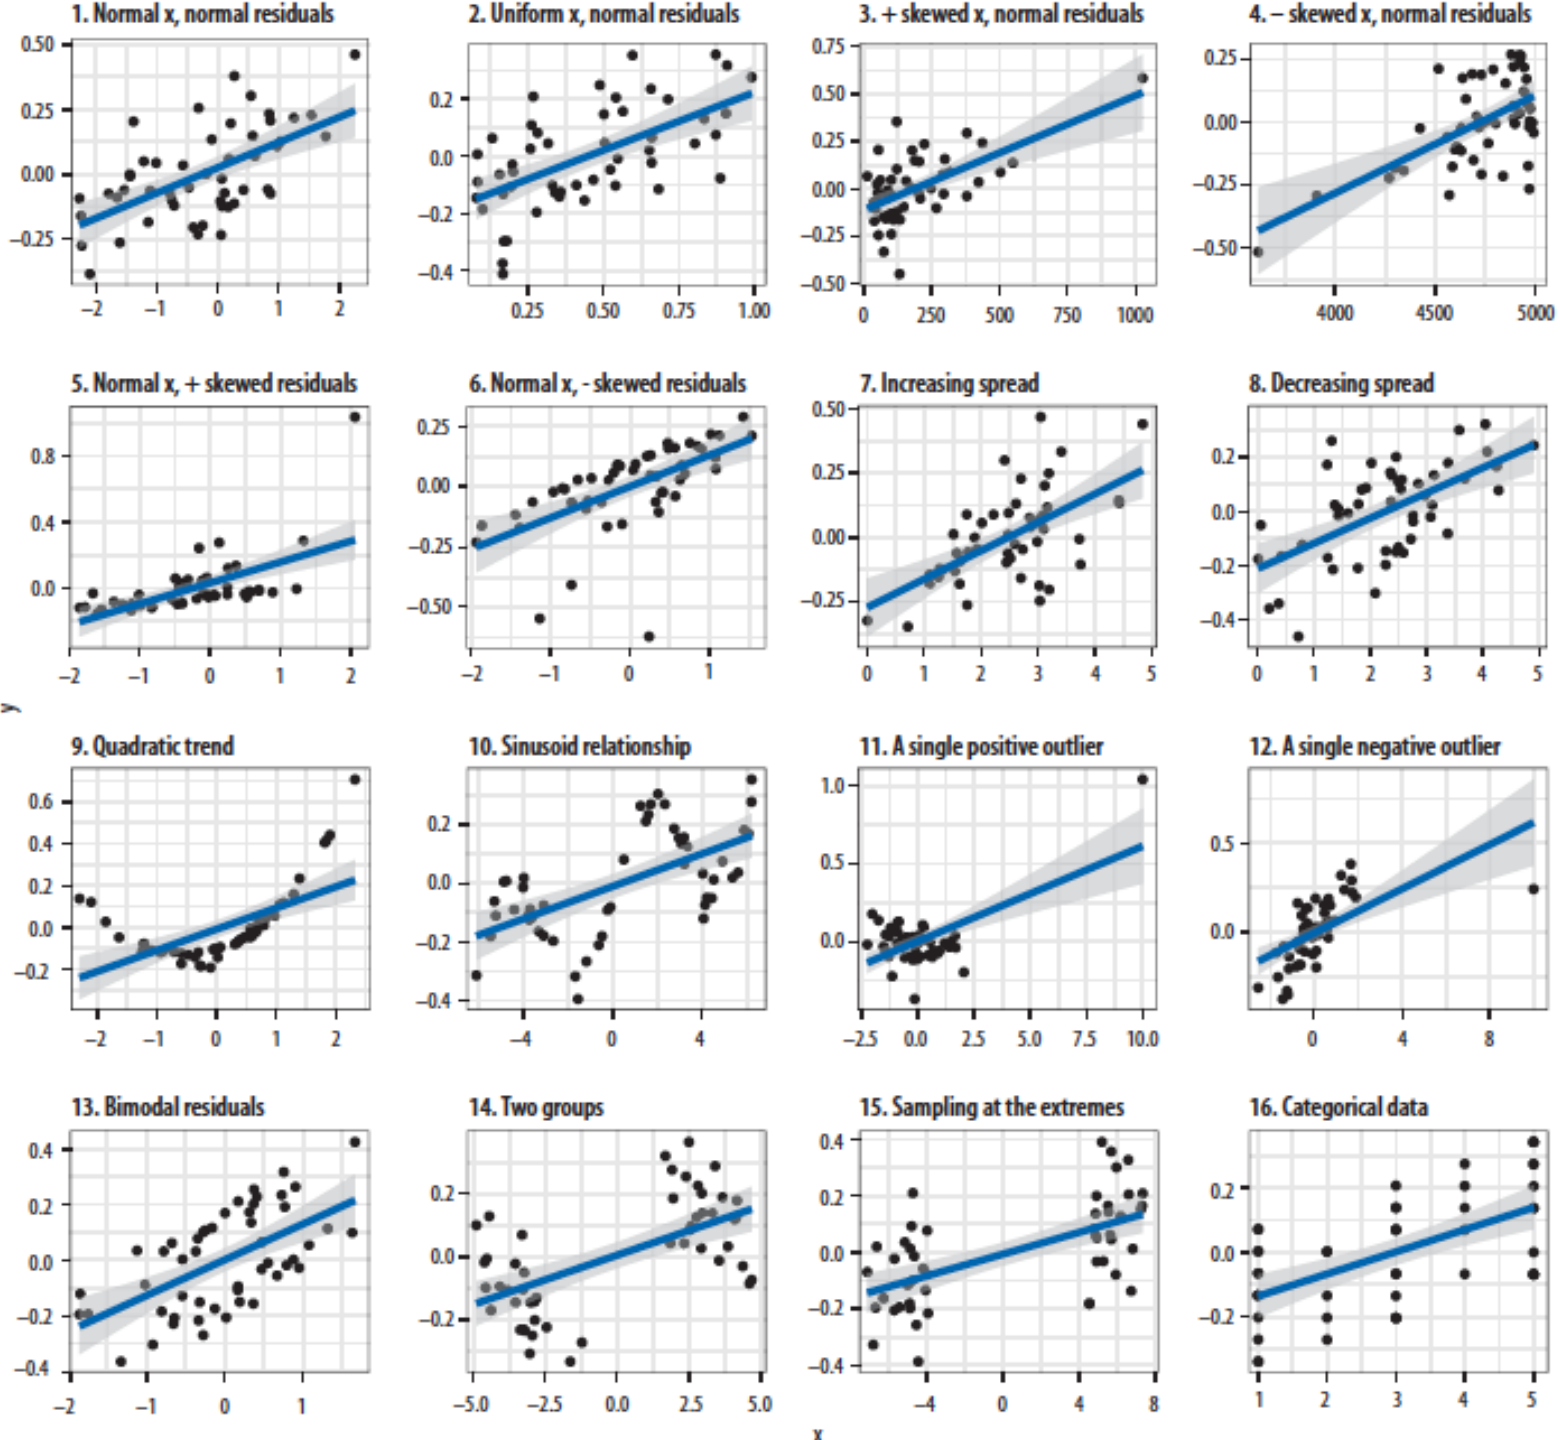
Data visualization

- **For exploration, data analysis ←**
- For communication
- For entertainment



Anscombe's quartet

Source: Healy (2019)



Source: Healy (2019)

Graphics for data analysis

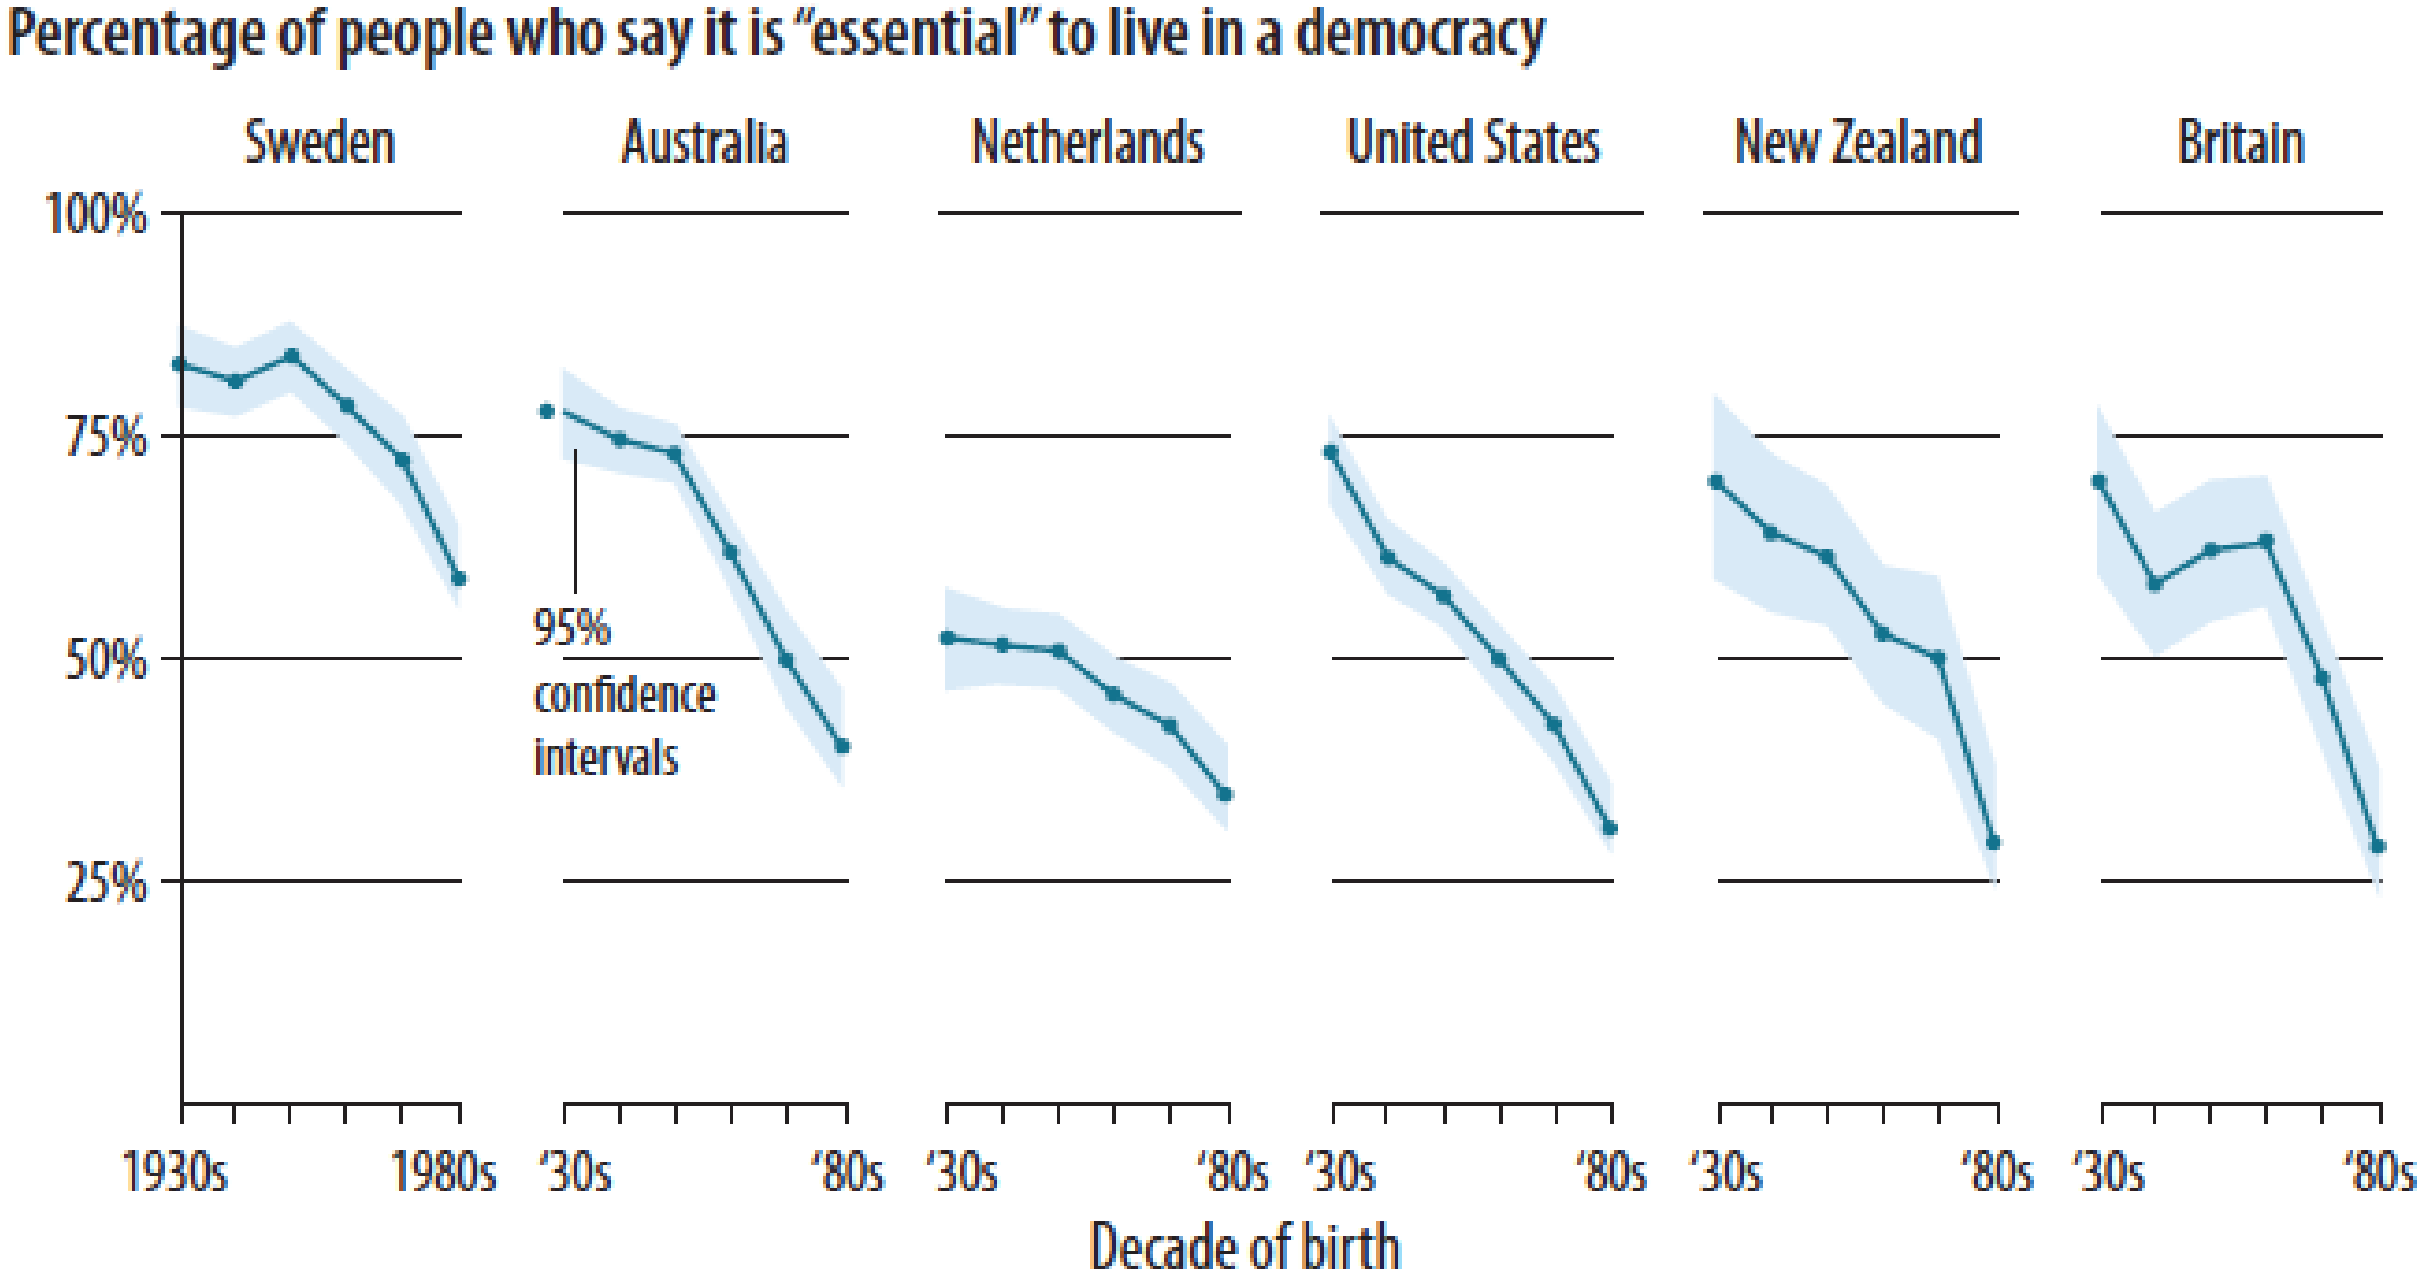
- The **human retina** can transfer around 10^6 or 10^7 bits per second to the brain;
- **Reading** transfers about 3 words, so $\sim 10^2$ or 10^3 bits/s;
- Potentially (!) visualization is about 4 orders of magnitude more powerful.

How can we leverage the human visual system to analyze data?

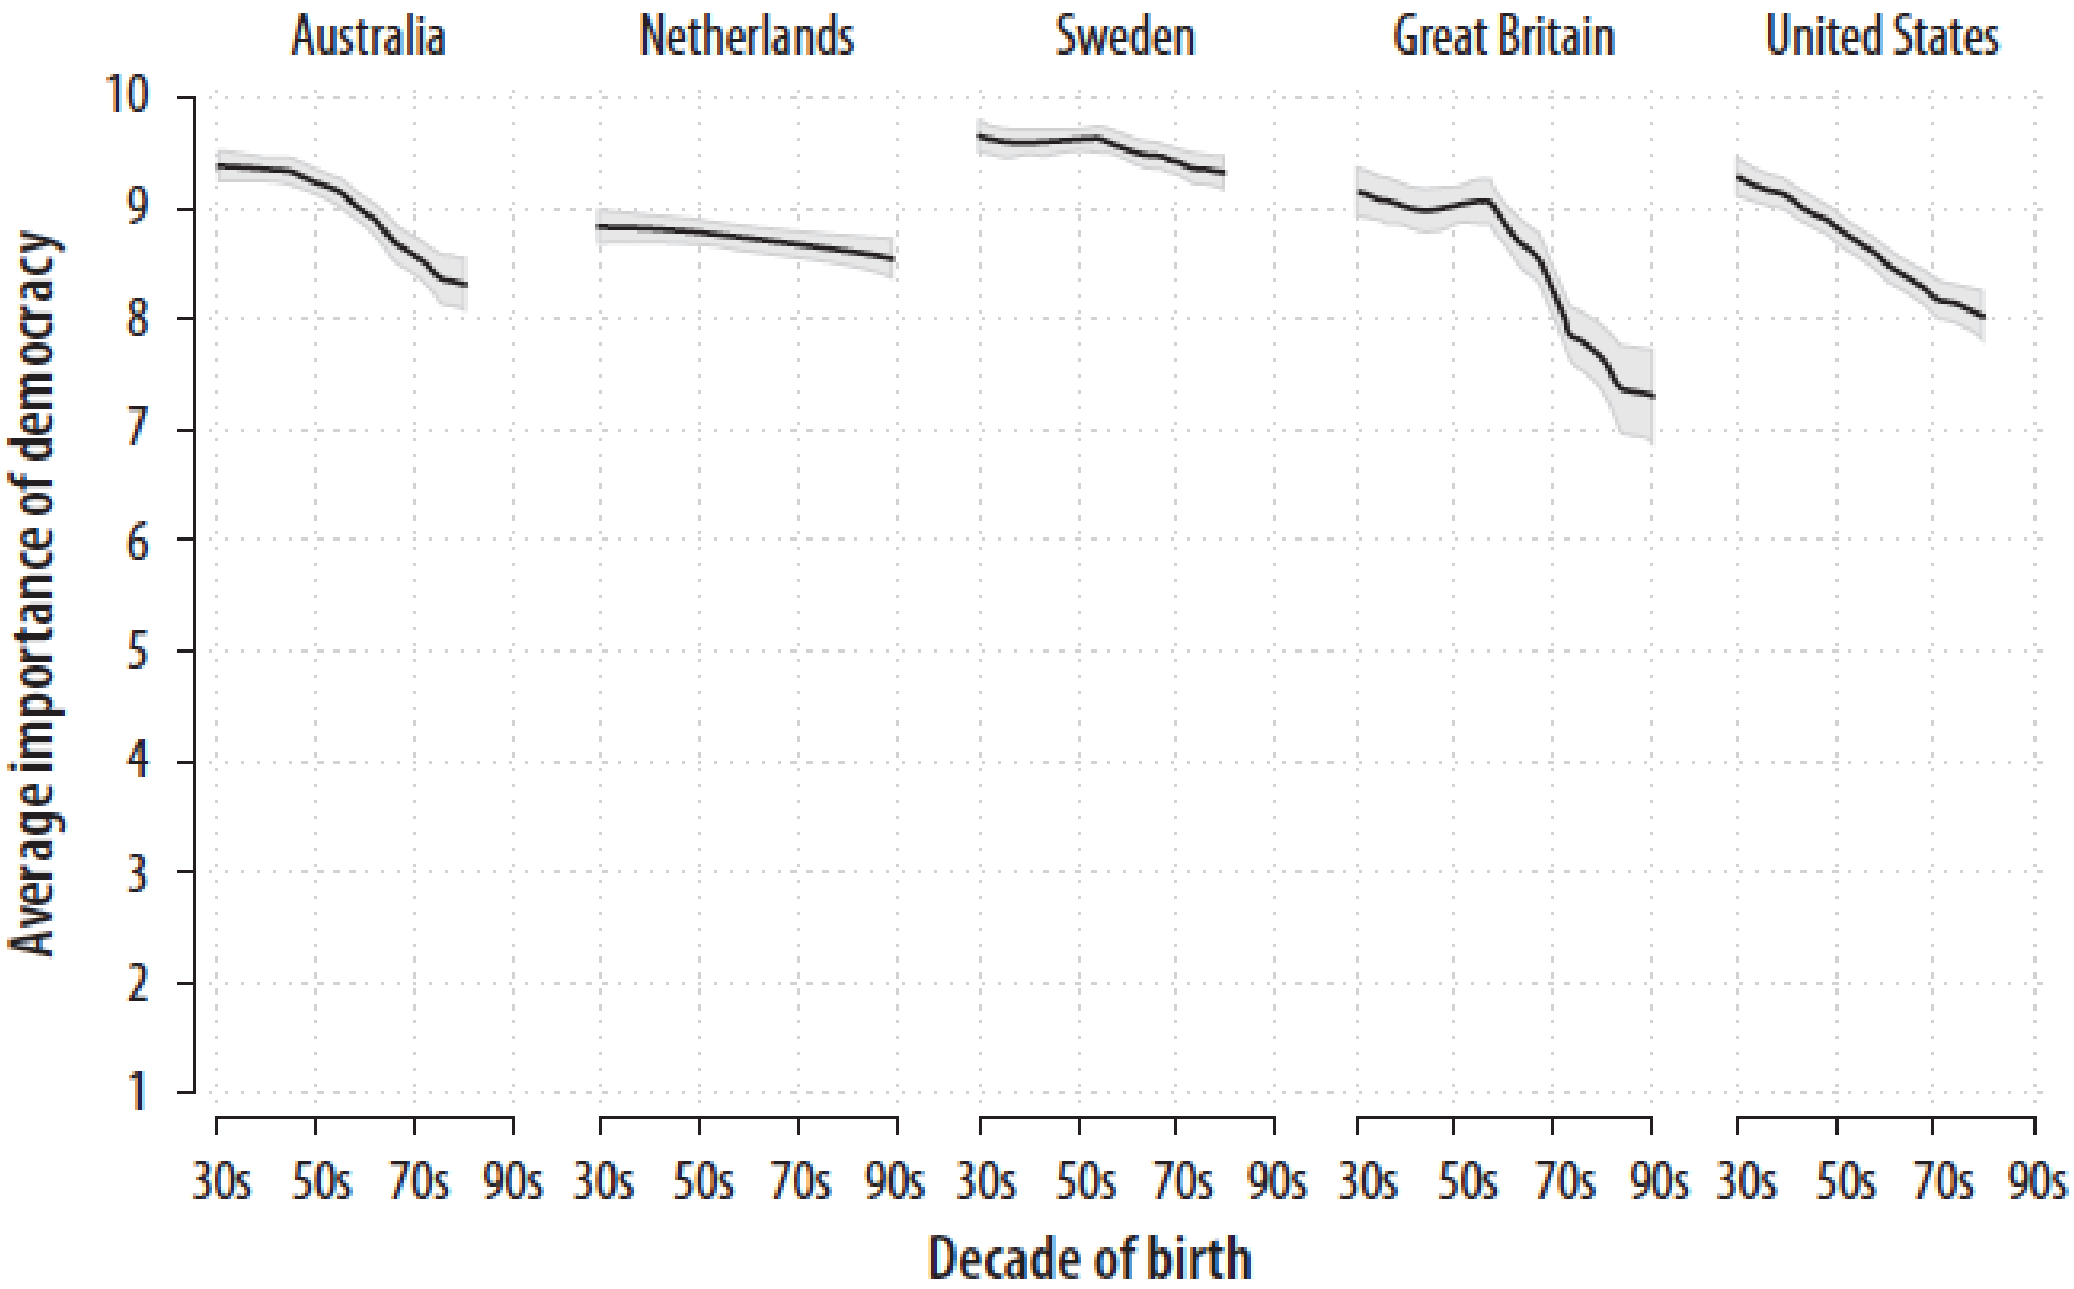
Plotting the right thing

Most common problems:

- (Accidentally) misrepresenting what is being plotted
- Omitting baselines



Source: Healy (2019)

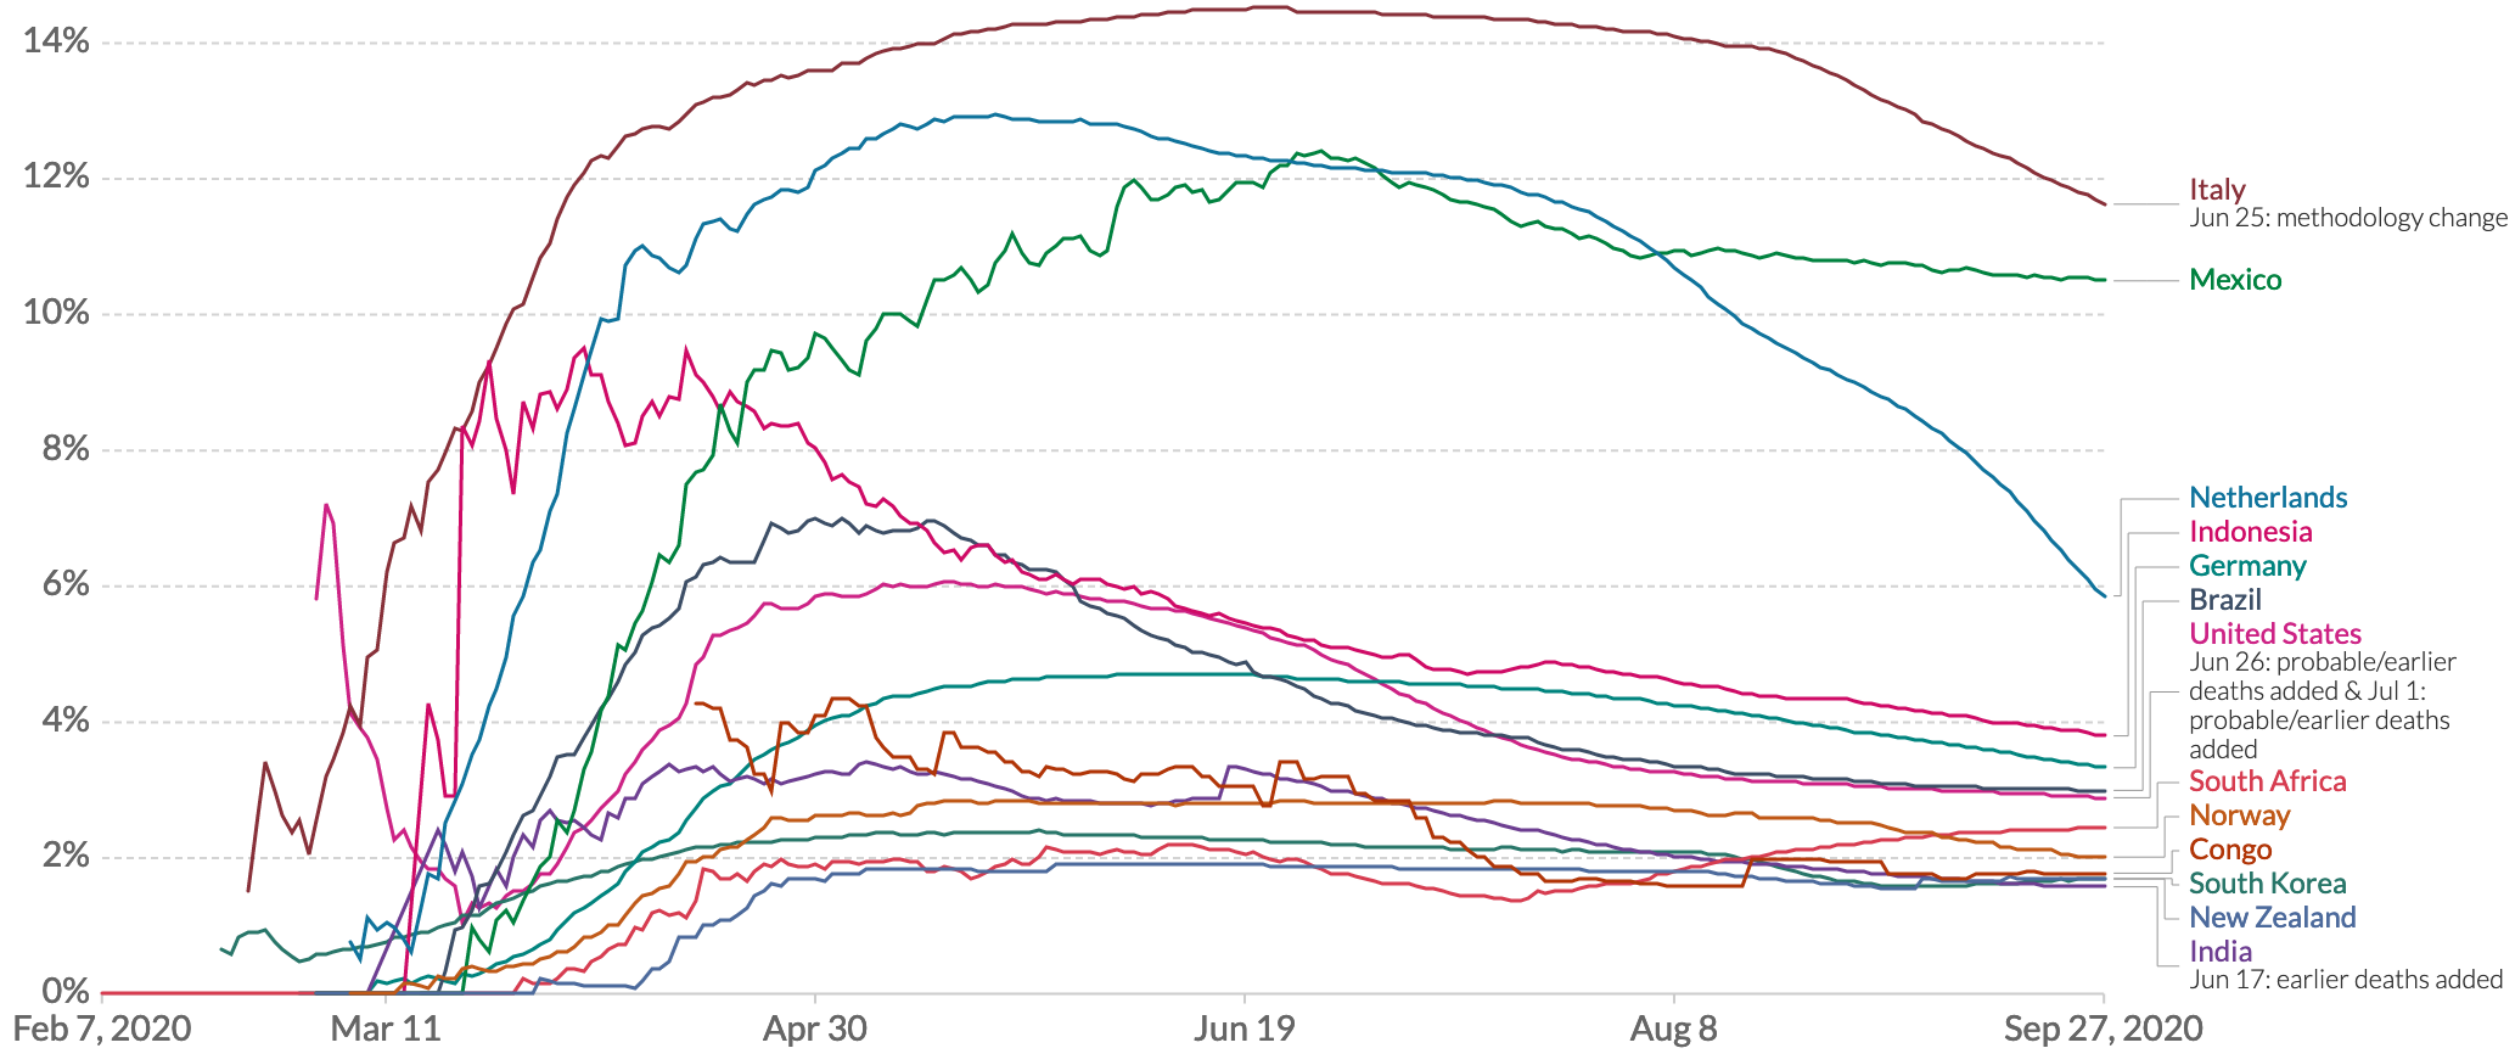


Source: Healy (2019)

Case fatality rate of the ongoing COVID-19 pandemic

The Case Fatality Rate (CFR) is the ratio between confirmed deaths and confirmed cases. During an outbreak of a pandemic the CFR is a poor measure of the mortality risk of the disease. We explain this in detail at OurWorldInData.org/Coronavirus

Our World in Data



Source: European CDC – Situation Update Worldwide – Last updated 27 September, 10:05 (London time)

Death rates have climbed far above historical averages in many countries that have faced Covid-19 outbreaks

Number of deaths per week from all causes, 2020 vs recent years:

Shading indicates total excess deaths during outbreak

Making pictures that help analyze data

- We'd like to make, not just any kind of picture or graph, but one that transfers some part of the data to our brain
- How do we make sure that the graphs we make transfer:
  - The right part of the data, and;
  - As much of it as possible?

This is where the **"grammar of graphics"** comes in.

Goal is to **specify how data map to picture**, so the correct type and largest amount possible is transferred

Grammar of graphics (Wickham version)

- http://r4ds.had.co.nz/visualize.html
- Map raw data to following elements:
  - Aesthetics (position, shape, color, ...)
  - Geometric objects (points, lines, bars, ...)
  - Scales (continuous, discrete, ...)
  - Facets (small multiples)
- Additionally, can apply:
  - Statistical transformation (identity, binning, median, ...)
  - Coordinate system (Cartesian, polar, parallel, ...

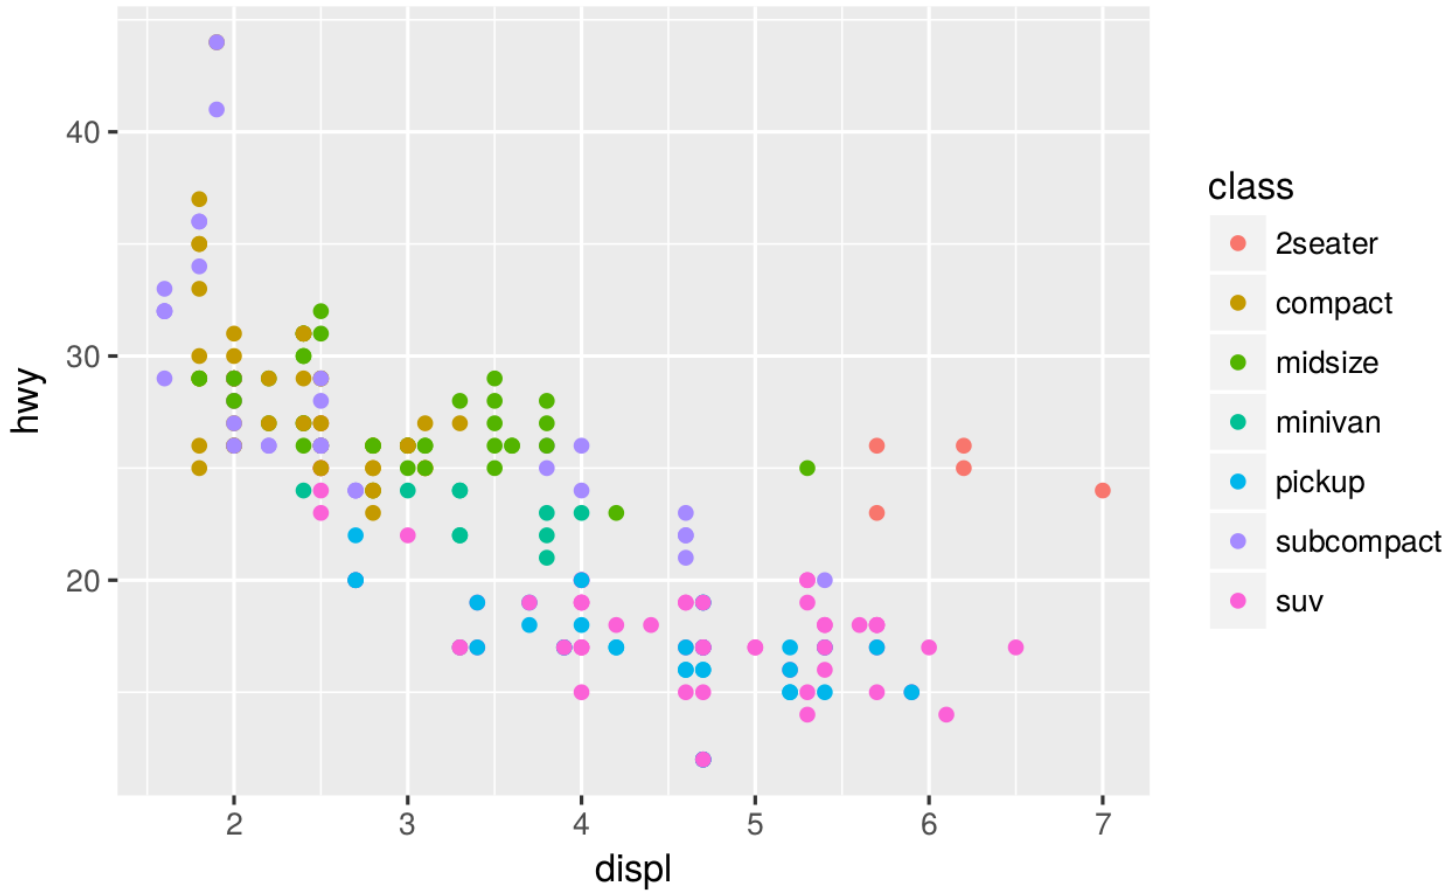
Grammar of graphics (Wickham version)

In R, grammar of graphics is implemented in `ggplot`, a function in the `ggplot2` package.

Example data set: cars

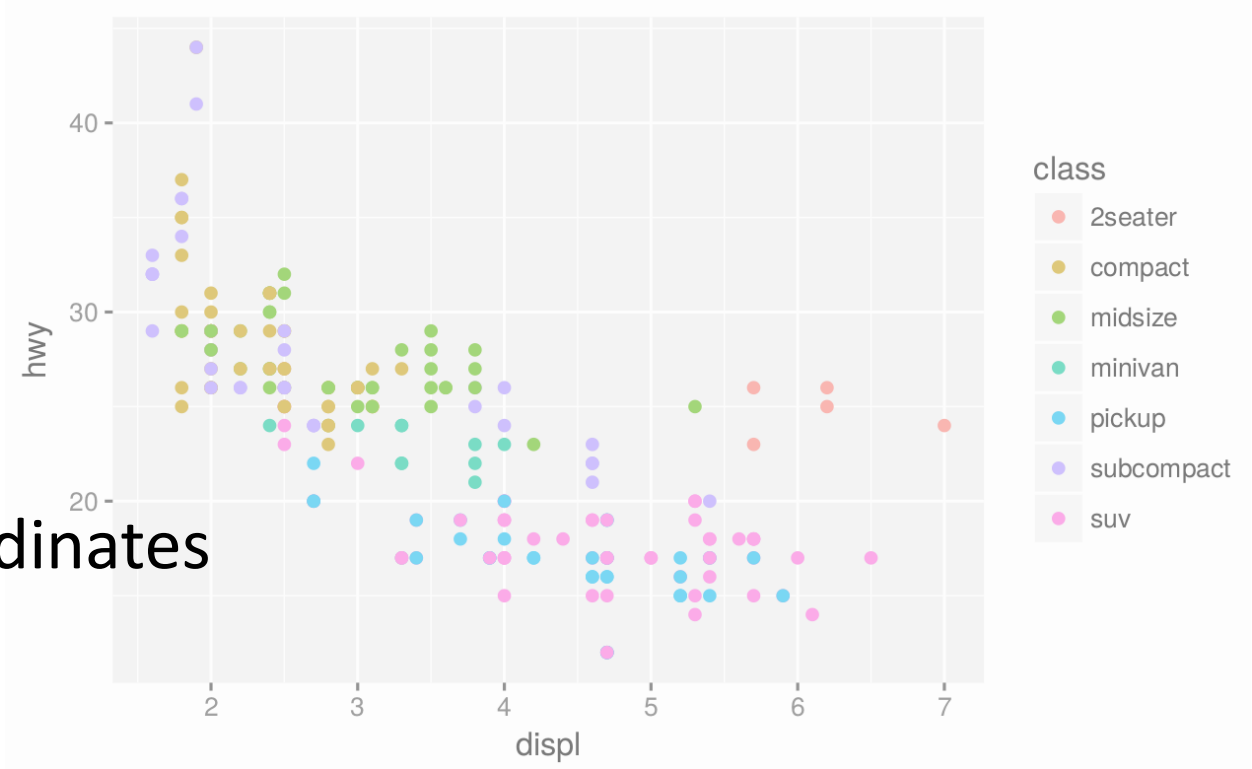
```
mpg
#> # A tibble: 234 × 11
#>    manufacturer model displ  year   cyl      trans   drv   cty   hwy    fl
#>           <chr> <chr> <dbl> <int> <int>      <chr> <chr> <int> <int> <chr>
#> 1          audi    a4   1.8  1999     4   auto(l5)     f    18    29     p
#> 2          audi    a4   1.8  1999     4 manual(m5)     f    21    29     p
#> 3          audi    a4   2.0  2008     4 manual(m6)     f    20    31     p
#> 4          audi    a4   2.0  2008     4   auto(av)     f    21    30     p
#> 5          audi    a4   2.8  1999     6   auto(l5)     f    16    26     p
#> 6          audi    a4   2.8  1999     6 manual(m5)     f    18    26     p
#> # ... with 228 more rows, and 1 more variables: class <chr>
```

```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy,
                           color = class))
```



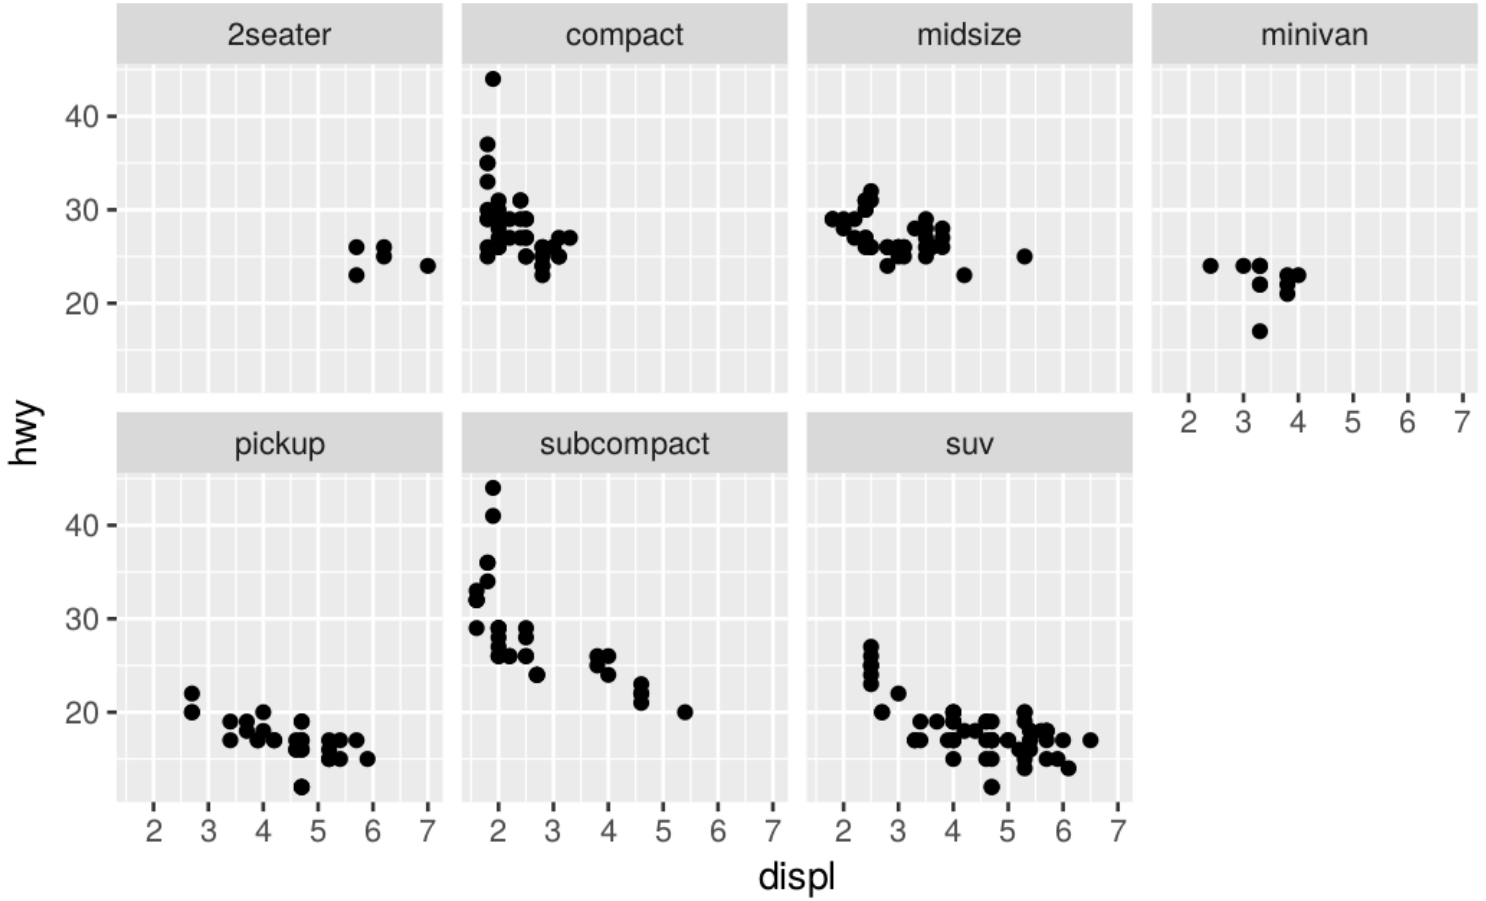
```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy,
                           color = class))
```

- Aesthetics:
  - x-position mapped to engine size
  - y-position mapped to fuel efficiency
  - color mapped to car type
- Geometric objects: points
- Transformation: identity
- Scales: continuous, cartesian coordinates
- No facets



Facets

```
ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy)) +
  facet_wrap(~ class, nrow = 2)
```



Transformation (stats)

1. **`geom_bar()`** begins with the **`diamonds`** data set

2. **`geom_bar()`** transforms the data with the "count" stat, which returns a data set of cut values and counts.

3. **`geom_bar()`** uses the transformed data to build the plot. cut is mapped to the x axis, count is mapped to the y axis.

carat	cut	color	clarity	depth	table	price	x	y	z
0.23	Ideal	E	SI2	61.5	55	326	3.95	3.98	2.43

How many 5s in this display?

1561321203658413076510374627
4173127527327592732990709742
1703707774179527931749270973
4019743217909370945179279417

How many 5s in this display?

1561321203658413076510374627
4173127527327592732990709742
1703707774179527931749270973
4019743217909370945179279417

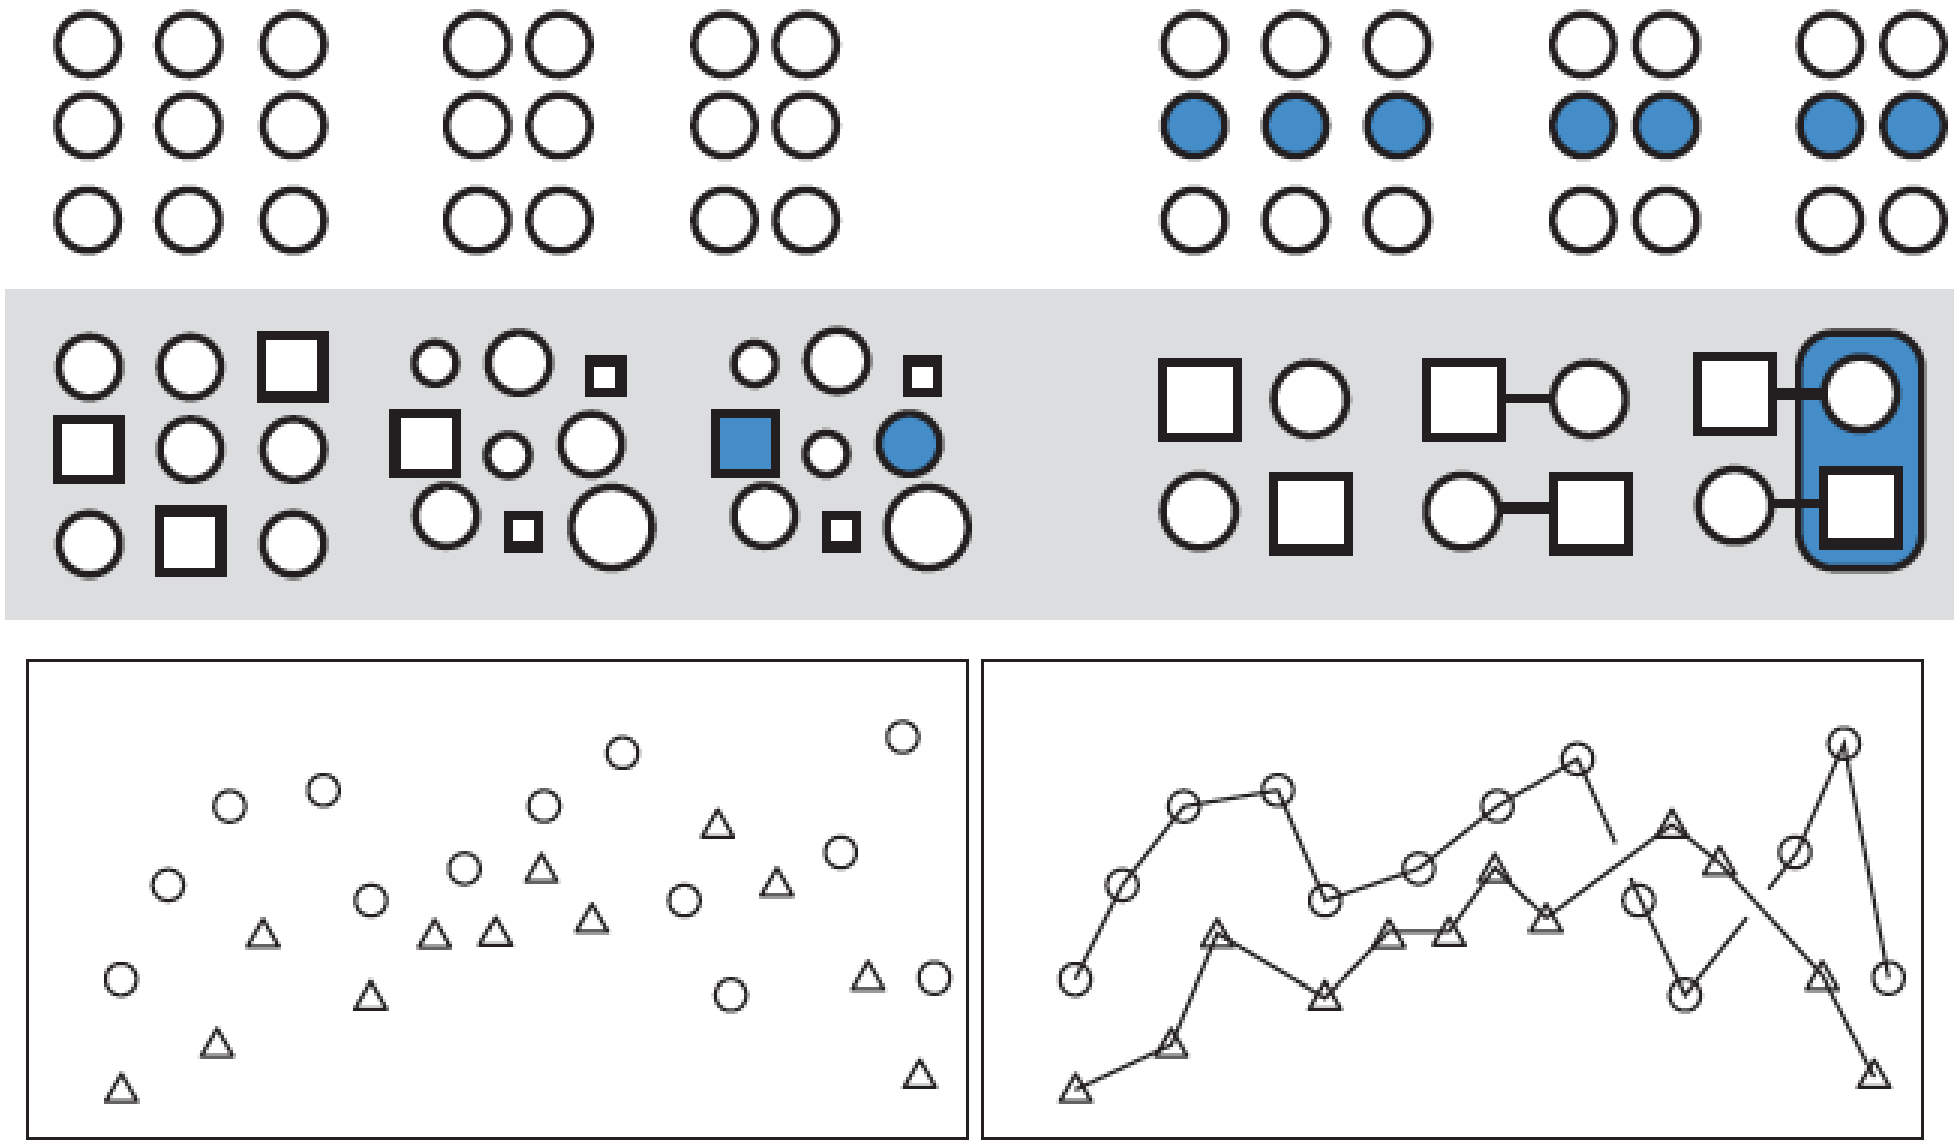
Numerals differ only in shape, and are high-level symbols
You have to literally scan them **all** & count the 5s.
The distinction of color is immediate & **pre-attentive**
You only have to scan & count the 5s.

This is why color is an important visual attribute for a categorical variable in graphs

Source: **Michael Friendly**, http://euclid.psych.yorku.ca/www/psy6135/#Graphical_Perception

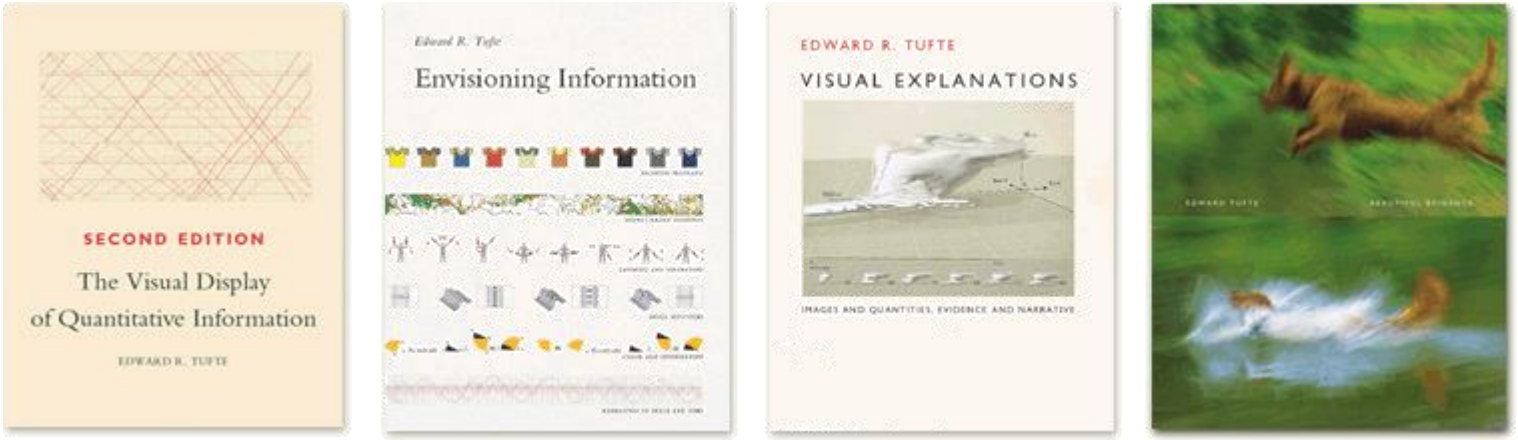
Gestalt principles of relatedness

- **Proximity**: Things that are spatially near to one another seem to be related.
- **Similarity:** Things that look alike seem to be related.
- **Connection**: Things that are visually tied to one another seem to be related.
- **Continuity**: Partially hidden objects are completed into familiar shapes.
- **Closure**: Incomplete shapes are perceived as complete.
- **Figure and ground**: Visual elements are taken to be either in the foreground or in the background.
- **Common fate**: Elements sharing a direction of movement are perceived as a unit.



Source: Healy (2019)

Some (distilled) principles from Tufte



- Ask how data maps to perception
- Ask which comparisons you want, guide eye to those
- Maximize data-to-ink ratio
- Present more data (without losing interpretability)
- Use levels of detail
- (Remember narrative)

Tufte wisdom

- Tufte's principles are more oriented to communication and can be taken too far

- Better data/ink → display more information without overload;
- Thinking about perception can help you choose better geoms, aesthetics.

Some practice

Answer these questions:

- Are we plotting the right thing?
- What are: aesthetics, geom, scale, facets, transformation, coordinate system
- How is data/ink?
- Is perception considered optimally?
- Can you think of questions you can’t answer from this plot which are in the data?

Conclusion

Conclusion

- Data visualization is data analysis + psychology;
- Sticking to **basic principles** helps:
  - **Map data** to aesthetics, geoms, scales, facets;
  - Perception research guides choices;
  - **Which comparisons** do I want?
  - Maximize **data-ink** (within reason).
- Some standard recipes (e.g. “barplot”, “histogram”, “line graph”), but pros do not need the cookbook…
- Don’t believe everything you hear (“do’s and don’ts”)
